## SUGGESTED IDENTIFICATION

U.S. Bureau of the Census. U.S. Census of Agriculture: 1954. Vol. III, Special Reports, Part 1, Multiple-Unit Operations. U. S. Government Printing Office, Washington, D. C., 1956.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington 25 , D. C., or any of the Field Offices of the Department of Commerce, Price $\$ 4.50$ (paper cover)

## PREFACE

Volume III, Special Reports, comprises a group of special compilations and summaries of data from the 1954 Census of Agriculture and related survers. Part 1 of Volume III. "Multiple-unit Operations," presents statistics for specified counties and State economic aress in 12 Southern States and Missouri on the number and characteristics of multiple-unit operations. farms in multiple inits, and farms not in multiple units. (omparable data from the 1950 ('ensus of Agriculture are alsu shown.

Farming units sperated hy crupurs, wen though these crepper units areparts or subunits of larger "perating units, have been considered as separate farms in the various Censuses of agriculture. The compilation of data on the basis of multiple units provides statistics for operating units larger than furms. Information presented in his report was ohtained for sjecifled counties in the Southern states and Missouri by the use of a seccial LandlordTenant Questionnaire in addition to the Agriculture Questionnaire.

This compilation of data for maltiple units was made as a part of the latit census of Agricultare. The 1 a.it (ensus of Agrinulture was taken in conformity with the Act of (ongress (Title 13, Lnited states (ocle) approved August 31, 19\%4, which inclades provision for the mid-decade Censuses of agriculture.

The collection of the data was carried ont by census emmerators directed by supervisors appointed by the Itirector of the Censue and working unter the directona of Jark B. Rubertson, then (Chef, Fjeld Divisinn. Embest R. Inderwomd, then sperial Assistant to the Director, was respansible for the recruatment of the tield staff. The phaning of the Censas and the compilathon of the statistics were supervised by Ray Ifurles, Chief, Agriculture Division, and Warder R, Jenkins, Assistant Chief. Thety were assisted hy Hilton E. Jobison, Orvin L. Wilhite, Huhert L. Collins, Benjamin J. Tepping, Lois Hutchison, Garl R. Nyman, J. Thomas Breen, Robert A. Overton, M, Vincent Limiquist, Russell V. Oliver, Charles F' Frazier, Gladys L. Eagle, Orville N. Slye, Gaylord G. Green, Harod N. Cox, and Henry A. Tucker.

The editing and coding of the Landlord-Tenant Questomaire, the preparation of the tables and othor material, and much of the analysis for this report were bone under the supervision of William A. Wright.

## UNITED STATES CENSUS OF AGRICULTURE: 1954 REPORTS

Volume I.-Counties and State Economic Areas. Statistics for counties include number of farms, acreage, value, and farm umerators; farms by color and tenure of olerator ; facilities and equipment; use of commercial fertilizer: farm labor; farm expenditures; livestock and livestock products; specified crops harvested; farms classitied by type of farm and by economic class; and value of products sold liy source.

Data for state ceonomic areas include farms and farm characteristics by tenure of operator, by type of farm, and by economic class. Volnmer 1 is published in 33 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | New England States: <br> Maine. |  | West North Ceniral: <br> Minnesota |  | East South Centrat-Continucd |

Volume II.-General Report. Statistics by subjects, United states ('ensus of Agriculture 190 . St Smmary data and analyses of the data for States. for Geographic Ibivlsions, and for the I nited States by subjects as illustrated by the chapter titles listed below:

| Chapter | 'Title | Chapter | Title |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Farms and Land in Farms | VII | Field Crops and Vegetables. |  |
| 111 | Age, Residence, lears on Farm, Work Off Farm, Farm Facilities, Farm Equipment. | VIII | Fruits and Nuts, Horticultural Specialties, Products. | Forest |
| IV | Farm Lahor. Lse of Fertilizer, Farm Expenditures, and | 1 N | Value of Farm Products. |  |
|  | Cash Rent. | X | Color, Race, and Tenure of Farm Operator. |  |
| V | Nize of Farm. | XJ | Economic Class of Farm. |  |
| V] | Livestock and Livestock Products. | XII | Type of Farm. |  |

## Volume III.-Special Reports

Part 1.-Multiple-unit Operations. This rebert will be simitar to lart 2 of Volume $V$ of the reports for the 1950 Consus of Agriculture. It will present statistics for apmonimately 900 counties and State economic areas in 12 southern states and Missouri for the number and chararteristics of multiple-unit operations and farms in multiple units.

Part 2.-Ranking Agrlcultural Countles. This special remort will present statisties for selected items of inventory and agrieultural production for the leading commties in the United States.

Part 3.-Alaska, Hawaii, Puerto Rico, District of Columbia, and U. S. Possessions. These areas were not included in the 19.5 Census of Agriculture. The available current data from various dovernment sources will be compiled and published in this repert.

Part 4.-Agriculture, 1954, a Graphic Summary. This report will present graphically some of the significant facts regarding agriculture and agrionlural production as revealed by the 1954 Census of Agriculture.

Part 5.-Farm-mortgage Debt. This will be a cooperative study by the Agricuttural Research Serrice of the U. S. Department of Agrienture and the Burean of the Census. It will present, by States, data based on the 196-4 Census of Agri-ulture and a special mail survey to be conducted in January 1956, on the number of mottgated farms, the amonnt of mortgige debt, and the amount of debt held bs principal lending agencies.

Part 6.-Irrigation in Humid areas. This cooperative rejort by the Agricultural Researd Service of the U. S. Department of Agriculture and the Burean of the Census will present data obtained by a mail survey of operators of irrigated farms in 28 States on the somper of water, method of aplying water, number of pmops used, acres of crops irrizated in 1954 and 1955, the number of times earh erop was irrigated, and the cost of irrigation equipment and the irrigation system.

Part 7.-Popular Report of the 1954 Census of Agriculture. This repert is planned to the a general, easy-toread publication tor the general public on the status and bread characteristics of United States igrioulture. It will seek to delineate such aspects of agriculture as the geographic distribution and differences hy size of farm for such items as farm acreage, principal crops, and impertant kinds of livestock, farm facilities, farm equipment, use of fertilizer, soril conservation practices, farm tenure, and farm income.

Part 8.-Size of Operation by Type of Farm. This will be a conperative special remort to he prepared in comeration with the Agrioultural Research Service of the U. S. Department of Agriculture. This relort will contain data for 119 economic subregions, (essentally general type-of-farming areas) showing the general characteristics for anch tyje of farm by economic elass. It will provide data $f o r$ a arrent analysis of the differences that exist among sroups of farms of the same type. It will furnish statistical basis for a realistic examination of production of surl commodities as wheat, cottom, and dairy products in connertion with actual or proposed povarmental polieies and programs.

TABLES FOR COUNTIES AND STATE ECONONIC AREAS

## INTRODUCTION

(VII)

## MULTIPLE-UNIT OPERATIONS

Introduction.-The landholdings of many landlords comprise two or more farms according to the Census Bureau definition of a farm. If a landlord has two or more sharecroplers or other classes of tenants, the portion operated or each is considered a separate Census farm. Likewise, if a portion is retained by the landlord for his own use, that, also, is a separate farm.

There are mang landlords in the South having two or more farms, as detined by the Census, who think of all of their landholdings as representing one operational unit. This may be because the landord follows an overall rotation practice for the cropland; because of a comminity use of the pastureham by livestock of the landlord and tenants: hecause of the joint use of machinery and work stock owned by the landlord: or because of other joint rentures such as the purchase of, or sharing in the cost of, fertilizer, feed, seed, and other supplies. The handord: concent that all of his land comprises one operation:a unit is given support if he supervises the activities of his temants, especially the seeding, cultivating, and harvesting of crops. If the land lord makes the decisions in respect to marketing the crups, even though he has only a part interest in them, he has a strunger reason for thinking of all of his land as one unit. An operatlonal unit which does not, in the mind of the landord, coincide with the Census detinition of a farm, ls usmally, but not nlways, one in which the landlord provides the catital and management and the tenant provides the labor for carrying on the farming "ןerations. In most rases, such tenants are sharecrofurs.

The argument has been advanced that sharecrofers are hired laborers and, therefore, are hut farm oneraturs. Comparimons of reosraphie, ewonomic, and social data, hased on averages or percentages for all farms with cromers indmbed, are significantly affected by data for cropers in the areas in which sharecroljers predominate.

Sharecroppers are more than hired homers since they share in production costs, risks, and rewards. Even though the land ford provides the initial outlay for operating capital, the temant eventually mays for his share of such costs unless the agreed upon share of the crop whirh the tenant remives is find at a smaller percentuge to compensite the landlurd for his larger comtribution. If the crop is a pour one or pries are low, the crobler's cash receipts are reduced substantially. On the other bamb, if the crop is a bumper one and prices are pood, the croper shmbly be in a better economic position than if he had received cash wages only. Moreover, it is not unnsuat for a cropper who supplies little or bo but-of-pocket expenses for froduction to be partially or wholly on his own in respect to conducting all uperations in connection with making a rop. It serms reasomable, then, for the census to consider sharecrophers to be tenant farm operators. It follows that the land assimed to ench should be treated as a separate Census farm. However, the Census has recognized the need for statisties regarding the characterlstics and operatlons of those larger over-all eperating units which apyear to contain two or more Census-defined farms. Therefore, supplemental rpporting forms bave been used in several of the enumerations to get additional facts about what have recently been termed "multiple-unit operations" or "multhple units."

The concept of an operational unit which differs from a Census-defned farm is diffent to establish for general and com-
parable application. Field tests indicated that subjective criteria regarding the operational mit, such as the extent of an over-all rotation practice and the amome of supervision exercised by the landord wer the farming oprations and over the warketing of the crops. cannot be applied effectively. On the other hand, objective criteria, suth as the furnishing of work anmaks and or tractor pewer by the landurd and the kind of rent paid. ean the more easily undorstond and applied. It is these latter criteria which the census has used in order to furnish supplemental data for operational units which differ from Censusdetined farms.

Among individaal hambords. contributions to poduction, whether in rabitat or mangement. may vary greatly for their respective temants. Thas, a qiven landhed may rent hand to one or more tonats for cash amb ant conern himself with the eropping aferations: he may rent his land on a share basis to temants Wha furnish their wwn work stock or tractor power, tillage tools, and harvesting equipment ; or he may arrange to have his lams worked wh shares by persons who are mot thandially the to ancume any asts of froduction other than those reperesented by their wat lator and that of other members of their family. some of these persins shating in the erop promberion, whether
 mat be given mon survision ; oflers may be given limited superrision: white still whers are instructed or sumervised daty in their current antivitios. bemerally, the preater the contribution hy the labdond. the greater is the need for him to maintain control wer the proluction and marketing activities, espectally thase fonerned with the growing of the dash repse

Factors giving rise to multiple-unit operations. - The type of "peratimat unit, which comprises two mere Census definted farms, is not widely fomm outside the south, exept pessibly in a limben number of father-son uprations. Even in the south,
 "ithin a state, in the frequencs of ewormene of operatiomal anit. Which might be though of as comprixing two of moge Consus fitms. The differences in aphlimation of the terms "operational
 and tohaco-growing ureas.

The multiphe-nimit type of operation was largely an outgrowth of the changenver from slavery to "freedmen" and the rehabilitation of sobliers following the C'ivil War. This arrungement, growing wit of the conditions following the var, permitted the landowner and workers to continue to farm the same land rosources. The former slawes, with lithe ophortmity for earning a bivelihood exeept on the hand of their former owners or that of nearby owners, continned to look to the phantation owner for direction and subsistence. With neither funds nur eredit for paying a cash wage, the plantation owner patd his workers a part of the crop).

After the Civil War, the maltiple unit type of operation soon beeame common throughout mush of the Old Nouth, with land lords employing white as well as Negro tenants. Under the multiple-nnit system, the landowner provided the land, management, work stork, and equipment. The worker or tenant provided the lalor, his own and that of his family. The landlord made advances th the worker for food and other exponses. C'ash
expenditures for production were most often shared equally, the temant's share being paid for by the landord and representing an advance against the tenant's share of the crob. The crop also was unually shared equally, the handord deducting from the tenant"s share all advances malle against the crop.

Becanse of their high labor requirements, cotton and tobacco have been the crols best suited to joint ventures bs landlord and temant. In their culture it is not neesesary for the latudord to risk the large amomats of capital which would be required mater a wage system. Risks of production are shared bs the tenants. The landlord, through his manarement and close supervision of the temats, can exercise control ofer farming practices. Handing the entire landholding as onc management unit permits some economies of large-scate operation which would not be possible if each tenant nperated independently. Sharing in the proceeds from the crop, the temant is less likely to leave hefore the crop is marketed. Workers, without funds or managerial experience to set themselves uy as independent farm operators. can engase in
farmins, sharing in the proceeds from their labor in the same manmer as impepemdent tenants.
Impact of mechanization on multiple-unit operations.-The number of multiple-unit operations and the number of subunits (this number coincides chosely with the number of Census-defined farms) comprising the larger operational holdings has been decreasing. Acreage allotments, mechanization, and expanding and more attractive opportunities for off-farm employment, particularly in periods of generally declining farm income, have been responsible, in part, for the movement of agricultural workers from the land. But, in the past 5 -sear period, the decrease in multiple units and subunits has heen in the number of units engaged in cotton production while the mumber growing tobacco has not changed. The figures, shown in the accompansing text table, indicate in a ineneral manner what has ncourred in the number of farms (or units) producing cotton and tobacco and the acreage harvested for each of these crops.

FA Not avalable on a comparable basis.

Increased mechanization of all phases of cotton production has elminated the need for mach malnal labor. The shifting of the center of cotton production from the Old south toward the sonthwest and the West, where labor has heen scarce and where larger arreages and more level land exist, has favored the increased bse of machines. fotton and tobace have been the crops most chond associated with moltiple-unit operations and it now apbears that coton eulture is becoming less depembent on joint ventures of lamdords and their tenants. The number of manhours required to produce and harvest a crol' seems to be the
most important factor in the past and in the changing situation. Survess have been conducted by the United States Department of Agrialiture to determine production practices and man-labor, fuwer'. mathimery, and material rednirements for some of the ibuportant ropis in selected type-of-farming areas throughout the United states. There is a striking contrast in the labor requirements for wotton and tobaceo produrtion on the one hand and corn and wheat on the other. Comin and wheat were once har vester] with crude hand-touls and the motern corn picker and arain combine evolyd throngh years of change and pxperimenta-

tion. The data in the aceompansing table ilustrate the relative requirements, in the recent past, in respect to man-hours, tractorhours, and work stock-hours per acre for these crops in a few selected areas. (Very favorable areas for mechanized mon and Wheat culture werw selected purgosels.

Generaliy speaking, tobaco growing requires four times as many man-hours per acre as does cotton. Cotton rafluires st 20 . or even more, times the man-bomrs as corn and wheat. The tractor, the mechanical moton picker, chenical defoliants and weedkillers, and airplane dusting and spraying are taking moch of the drudgres out of cotton growing. If amd when these improved machines and mothods are in general use, the prodlictivity per man-homr for cotton farms will he greatls increased. A comparjoon of the relative amount of man-lalmor injut for at highly mechanized area in the High Plaine of Texas ferens Hastern areas where more human resumbes are utilized, indinate signifleant poscibilities for rhangu.

Tobaren is a crop for whinh the Buman hator requirements ate still large. The number of subunits engaged in its benduction has not changed matoriatly in rewent yars The fart that mas. and wen grains, of corn athl bulls of motton atm menhatiorally

 being share tratats tu whom the lanulord furnished all the wark
 the same matmor llowever, in 194. ablad thereafter, ther dotormbation of renger farms has heath mathe largely on the havis of work power furnhbed, with less attention heing given to whether the land was rented on a share hasis. In the census of 1040 . the incuiry in respect to pewer furnishat by the landloril was broadened to indmete tractor power. In the last two rensuses the inquiry was worted, "I boes tha landurd furnish . N. 1 , the work animals or tractor puwer las a part of his slare in the operation of this places)?

After 1910, no further attempt to emumerate plantations or moltiple units as "perational bnits was made natil 1940 when speclal plantation questionnaires were obtamad during the *numeration. In 194., 195d, and 195t, there has leen an enumeration of moltiplemit operations. The statisties for multple units or pantations for the 1954, 1950, 1945, 1940, and 1910 censuses were prepared for the purpose of supplementing the basic reports of the census of Agriaulture in order to indieate more fully the organization of Southern agriculture. How-
ever, differences in definitions and procedures, and in the area jtcluded, hare made difforalt comparisons of the data for these gears and the measuring of changes.

A presentation of the reiteria need in the thret censuses prior to 1otion fon enumerating werational units larcer than farms follows. The criteria used in 1950 and 10.54 are given separate treatment under sumending topiabl headimgs. The fomparability of the data for all years is covered later under the title, "comparability of multiple-mant statistios for 1 late with prior ('uncuses.

L'rior to 1:4-h, a different aproach was used in each attempt to (fnumerate Mantation or maltiple-unit agriculture. At that time. Howe (ansideration was given to size of operation than at persent. Amparently, the "ometation implied hy the ward, "plantation," was uppermos in the nifind of the flamerers.

In 1 ! 110 . The Cemank Bure:n adopted the following definition of What was tormed a tenant phantation:

 lamblord. Ihowever, there was mot an manamity as to the ease or the methen of differentiatitir what shondel be treated as mol-tiple-mat tyev of oferation as distiat from "farms" and even from lamiloreltemant haldings.

At the apmoath of the time for priparmg questionnaires and premedures for the late enameration, it was the belief in the ('pasme loureat that the best case for a sumplatatary reporting form for the sonth was $1 f$ for its use to improve the statistics through redncing the pasibility of anplication or omission of information for ('ensus farms and 2 人) it shomble provile chata at a level of operation comparable with thons gathered for wher sertions of the linited states. This seremed tor suggest that share(roppers and the home farmes, mothing more, shond be prouped in order to amproach maversal comamability. The restriction of What should eonstitute a multiphe-nmit operation, as thus outlined. was not immediately aceeptable to some users of Census data.

These persons continued to hold that an "perating unit shoudd be something more intlusive.

In 1948 , a subcommitte consisting of teehnicians from the Bureau of the Census and from the Burean of Agricultural Ecomomies, 'raited States Department of Agriculture, was appointed to do some fielal testing, Members of this group, visitet several typical multiple-nnit areas. In each of these areas they were joined by rearesentatives of the state office of Agricultural Estimates of the Burean of Agricultural Eeonomics, Vnited states Fepartment of Agriculture. In Alabama and Texas, they Were also assisted by a specialist from the State Agriculturat college. To begin with, there was a general agreement to test whether a multiple unit combl be so detined and emumerated that it woult indute all land operated by fosely supervised tenants on a particular fandholding phas any land retained and operatetl by the landlord.

This subrommittee tried numerous questions athe approaches to determine whicli temants shoubl be included as a part of a moltiple unit. The most satisfactory single inguirs was that on work power. This is the tyle of information upon which the Census has placed most relianee in determining the cropper groul' of tenants. The characteristics of dependent tenants, other than croppers, varied from area to area and even from landholding to bandholding in the same locality. Criteria for their determination, which would work in one area would not work in another. In the variation, dependent tenants were furnished all the fertilizer by the landlord in lien of work power (i. e., the tenant furnished his own work power), the erop, being split $\mathbf{5 0}$-50, the same as for cropers. In another variation, the tenant owned the work animals and pait eash rent, but the lamethord actually provided the credit fur the purthase of the work animals ant held a mortgage on sueh work stork until paid for ont of the erop. Also, "furnish" was provided these tenants in the form of eash or credit advances in the same manner as for crobrers. Thes introduction of tractor farming in the plantation area bad resulted in a munber of variations in the eropper system inchoding a "through and throbgh" oferation whereby most "perations are performed for the antire arrenge withont regard to the land assigned to the several tenants. Chder surh an arrangement, the tractor drivers were usbally wage hants and the landlord made a charge for the tractor work performed for each tenant.

The possibility of using the share of crops paid as rent as the basis for determining the chosely shperviset temants was not frasible becanse of the mumerous variations from the traditional "half and halt" arrangement. Determination of the termendent tenants by the torms used lorally for these chasses of ternants was impratticable thedatuse of the rariations and inatlequacy of the terms used in different areas. Ledving the determination to the respondent, as in 1945, was not a satisfactory plan. Inguiries on extent of supervision and control of sale of crops were mot capable of brinsint forth uniform auswers. A change in respondent or in the questioner tonld also bring a change in the answer for the same situation.

Adoption of the landlord-tenant approach for the 1950 and 1954 Censuses.- Is a result of the lifis tiell testing, the derision was made to use, as the suphlemental questiomatare for the 1:bat emmeration, one which womb require a listing of the entire holding of a lambort provided two or more ( Cemsus-delined farms were emeompassed. In the composition of this reporting form, there were inguiries concerning the furnishing of work power and the sharing in the crogs of other method of making the rental payment. liecanse of the insistence of sperat persons acting in an atvisory rapacity a question was included to ascertain the respondent's idea as to which of his tenant operations were farmed as a separate operating notit. This latter inguiry was the only one which eonld be rarionsly interpreted by the respondent. or by the emanerator in case the latter was asked as to the intent of the question. For the gnidance of the emmerator the following worting was incorporated in the flustionnaire. 'A separate
operating unit is one which is indruendent of other units with respect to planning the use of the eropland; to the use of mathinery: or the purchase of fertilizer, sced, and supplies. The tenant, cropler, or renter recerbes little or no supervision from the landlord."

In Itso, after the matching and hamonizing of the two types of questionnaires, the Landlord-Tenant Questionnaire was examined to determine if the landlord hodding contained a multiple-mit operation. A meliminary study of the LandordTenant Questionaires indicated that the replies to the inguiry, "Is this plate farmed as a stparate operating unit?" cenbl mot be used as a satisfactory basis for separating the closely supervised or depentent tenants from those who operated their land independently. If the answers to this intuiry had been accepted, a large number of cash tenants and share temants paying onefourth of the crops as rent would have been intludet in montiple units while many of the croppers, even for these same landlords, womld have been excluded.

Therefore, it was decided to use the presence of eroppers, as detined by the Census (all work power furnished by the landord), as the only hasis for thetermining the existence of a multiple unit. It was recosnized that under this procedure some dependent tronats would be excluded from the multiple-unit operations. liketwise, a few eroppers whose operations were wholly seprarate as to. cropping or rotation practices and who were given little, if any, supervision womld be incluted. However, this peredural method for determining a multiple unit helped to satisfy thosp Who have stresist the lack of geosraphite comparability resulting from the rounting of eropper operations as farms. Finthermore, since the landlord-tenant bolding is something more inclusive than a moltible mit. it has been possible to present additional statistios both as to the momber of handowdenant operations athe as to their composition.

The 16nt procedure for enumerating both landlord-tenant operations and multiple-mit operations matehed that used in 1950 with the excention that the jutgment of the respondent in 1954 was not songht as to whether a given farm was a part of a larger operation mit. (As noted, the otfice processing in 1950 had to ifuore the juldment inguiry in respect to separate operating units. She second paragraph above.) Since the decision as to which operations represented moltiple units was made during the oftice processine in toth 19.0 and $19 \%$, the statistics as presented herein are reasonably comparable. The few factors making for a lack of comparability are ontlined in later paragraphs.

The questionnaires.-- In both 19\%t and 19\%0, the LandiordTedant Comestionnaire was used thronghout most of the South and in several southeastern counties of Missouri. It was used where sharecronners were most prevalent in cotton-, tobaceo-beanut-, ant rice-growing areas. It supplemented rather than replaced the Agriculture Questionnaire remuired for each censusdetined firm. An Auriculture Questionnaire was retuired for each ropper or temant other than cropper even though the landlora handled the entire hohding essentially as one operating unit. The Landlowd-Tenint Questiomaire was to be filled for the entire bandlord holding. Thus, the two reporting forms ohtained the same type of information but for different levels of operation.

Facsimiles of the landlord-Tenant Questiomaire and of the Agrichature Questmmaire far lyst are shown in the Appendix. There were several variations of the Agricalture Questionnaire in the maltiple-unit area. Most of the variations were in the inquiries relating to crons. Inquiries for croms not grown in the state and for crops grown only to a very limited extent were eliminated from the questionnaire for that state. A facsimile of the Aeritalture Questionnatre is shown in the Ahemdix only for Alabam: and Mississippi. The same version of the tuestionnate was used in these two states. There was only ont version of the Landord-Penant Questiomatire for the south and Missouri. sinee rise and tobaeco are not grown in the same areas, a combbined inquiry was used for these two crols.

The Landlord-Tenant Questionnaire was designed to serre two main purposes. In addition to providing statistical information for operations by persons who farm their land with tenants, including croppers, it was designed to help in obtaining more accurate reports for the individual Census farms represented in the landlord hotding. The 1954 version of the questionnaire, determined, first, the entire acreage under the control of the landlord whether through ownership, rental or lease, or management for others. With this total acreage in the holding as a starting point, information was sought, where possible from the person in charge, separately for each cropper or other tenant and for the residual (or "home farm") portion. Also, for each eropper or other tenant, questions had been formulated to secure the acreage assigned, the method of rental, and whether the enumerator, who was filling the Landford-Tenant Questionnaire, or some other enumerator, would be required to secure the Agrioulture Questionnaire.

In regard to additional information requested for 1454 , it was recognized that the person in charge of the wer-all landholding could usually give satisfactory answors for only those tenants with whons he shared in the production. For those tenants who paid (or receiced) a share of the crops, these further fuestions pertained to work power furnished by the landlord. number of horses and mules owned by the landlord bat kept on the tenantoperated land, acres of eropland harvested on the assignad land, and acrenge and production of suentied crops harvested.

Following the listing of the nathe and other required informa-
 totals for temants. Aumber line immediately following was providect for the "manerator to enter ap川licable romplemantary data for the "home farm." There was a tinall line for the enumerator to enter framd totals. in some collumas for the entire holding or operation and in otb+r cohmons for only the eombine operations of the share tenants timeluding "ropler-t and the "home farm."

To aid in cherking the Landlord-Tenant Questlonnaire with the matehing Agrienlture (enextionnaires for the tenonats and the "home farm," a column was provilen for enturing the identifying the number of eath household, from the linumerator's leaeord Book, for whieh an dgriculture gaextomanire was required However, this line number womld not be ataibable in those casse when the land oferated by a temant was in another enmmeration distriot. In sheh rases, the embmerator filling the Landlord. Tenant Questimmaire was askeff to enter the name of the fownship for district, precinct, ward, or beat in thich the lamy was loeated. If the land was in another comaty. has name of that county was required.

The enumeration.- Eath enumbrator was provided with an Enumerator's leoord book in which le was required to list the name of the head of each household in his renumeration distriet. For tracts on which ho olle was living, he was rempirel to list ther name of the person who rented the lamb, grew erops wh shares, wr used the land for beestock. If no agrionltural use was bejng made of the hand. lee was required to list the name of the owner of the land. Feeptions to this procedure were madt for ballt-up residential areas. There were sereming questions in this reard book to ascertain whirh tracts of land had agricultaral operations ant, therefore, would require an Agriculture Questionmaire, in whose name the report should he made, and whether he or some other emmerator shombatid the Agriculture Questionnaire.

In those areas where the Landlord-Tenant Questionnaire was used, a stightly different version of the Enmmerator's Record Book was used. This version carried one additional inquiry, viz, "What is the total number of persons who rent land from and who work land on shares for this person? $\square$ None. No. of per-sons-." An accompanying instruction reminded the enumerator that ( $a$ ) if a member of the honsthold operated a farm and if the answer to the question just cited wus 1 or more or ( $b$ ) if no mem-
her of the household operated a farm and the answer to this question was 2 or more, be should fill a Landlord-Tenant Questionnaire.

The Landlord-Tenant Questionnaire, also, indicated for whom this reporting form was to be filled, in this manner :

FOR WHOA SLIOLI, THIS Q[EESTONNAIRE BE FILLED?
(1) Lor every lervon whonerates a tarm himself, either alone or with the help of his fanily or wate hands, and also rents farm land to others or has land worked on shares by others. (OR
(2) For every ferson who does not onerate a farm himself. but remti farm land to two or more persoms or has farm land Worket on shares by two ar more persons.
There were instruetions on the form to interview the landord in order to get the required information for this questionnaire. Further, when pessible, this questionnaire should be eompleted before tilling the individual Agriculture Questionmaires which were regnired for each part of the wer-all areration. By so doing. the entmerator would be able to coys some of the information Which had beet whatmed from the landlorid. ant whieh had been fotered on the Landlord Temant Questionnatire, onto the Aerientther Questionmates. This was always possible for the "home farm" and, alsu. for eath tenant unless he farmed other fand. There was at serefle inctruction in the Emmmerator's Instruetion Book for the atmmeratur to vivit eath tenamt for whom he was requiret to fill an derimature Questionhaire. This was to insure : report for thase items in which the landlord hat no pro-
 (bnestumanire for a cenant on a landord-temant holding before the

 from the temant when llat tonant in question did wot own land and did bot have ambther landlated.

Enumeration of land in more than one cnumeration distrlct or county. Vith emunterator was assimed ateretic area in which
 ehamorator to whom a district was asimbed was responsible for the complete - mameration of all farms in that diverict. I lowever, sombe ('ehstas farms and some lamblordtenant operations are lonatorl in two or hore manmaration districts. In order to comant all the dand whee, but only onee, it was hewessary to establish rather rigid rules for deformining which commerator would be
 furms or larger holdings. In other words, one enmmeratar, not
 which lay in two enmmeration distriets dikewise, one pmamera tor, not both, was required to thll the lamdlord-remant Question natre for a handord-tanat hohding which was in two emanteration districts. This one retont, in the lirst case for a farm and in the second for a larger hobling, womid rower all the band, ineluding that which was in the other district.

Since two or more (ensus farms combrise a landlord-temant holding, it is gossible for a landlord tranat hobding to be in two separate emumeration districts and for the land in wele of the component (emsus farms to be wholly within an rammeration district. In such an instaner, two enmerafors would he charged with the duty of tilling the required reporting forms. One cmamerator would serure the Landlord-Tenant Questionatire for the over-all holding and also the Agrifoulture Questionnaire for any component census farms wholly in the same district. Another enumerator would need to till an Agriculture questionnaire for eath component census furm wholly within his district. This second enumerator, of course, would not be required to flll a lamet-lord-Teuant Questionnaire.

The Enumerator's Instruction Book for IGFA established the following rules of proedare for an enumerator whenever a part
or all of the land in a holding was in his district but the landlord or some of his tenants lived in another enumeration district.
(a) If he was to secure the Agriculture Questionnaire for the landlord he should also get the Landlord-Temant Questionnaire.
(b) If an Agriculture Questionnaire was not required fur the landmord, but the landlord and one or more of the tenants hived in his ristrict, he would get the Lindlord-Tenant Guestionnaire.
(e) If the landtord lived ontside his district bont farmed land where the landlord lived, or if the iandlord had tenants where the landlord lived, he was not to secure the LandlordTenant Questionnaire.
When all of the land of a landlord-tenant holding (or of the multiple-unit portion therwof) was in the same enumeration district, then the component rensus farms would also be wholls within the same district, provilled none of the temants on the land farmed additional acreage. Huwever, a tenant, in a land. lord-tenant holding. could also farm additional land. This addjtional land could be rented from a second landord of could lee owned bs the tenant. If a tenant of a landurd-tenant holding farmed more land, he would alwass be considered a tenant in the data presented for the labdord-tenant bolding for multiple-unit portion) whereas, in the connt of Census farms, he would be a part owner if he also farmed some land which he owned.

Problems in the enumeration of multiple-unit operations.-The multiple-unit tyle of operation has been difficult to define and to enumerate. Its vers existence has made it diffirult to obtain accurate totals for the various jtems on the Agriculture Questionnaire for tracts defined as census farms. In an enmmeration restricted to farms, a maltiple-unit operator, in answering the questions of the emmerator, may ( 1 ) correctly reburt waly for those crops grown on land not assigned to tenants and for livestock and equipment kept on the land retained : or (2) incorrectly include his part of the crops grown for him on shares and the work animals and equipment furnished to and kept hy his tenants ; or (3) incorrectly report all crops. livestock, exuipment, and expenditures for all the land in the multiple-unit holding. His tenants, on the other hand, may ( 1 ) corrects report for the crops they grew. for the livestock and equipment kent on the land assigned them, and for any expenditures which thes made for such items as fertilizer, feed, and petroleum fuel and, illso, those which their landlord made elther as the landlord's share or as an advance for prodnction on the temant's portion of the multipleunit operation: or $(2)$ ineorrectly report only their share of the crops, or only the livestack amd equipment they own, or only the pertion of expenditures whieh thes paid directly ont of pocket; or (3) fail to report any of their operations, assuming these will he included in the landlord's report.

The problem of obtaining accurate totals for geographic areas in which the maltiplt-unit operations exist has been mentioned in many of the Census reports hegimning with that of 1870 . The difficulty of this approach has been described in the reports of the 1870 and subsequent cemsuses of agriculture. The 1870 report states, "The plantations of the old slave states are squatted all over bs the former slaves, who hold small rortions of the soil, often very loosely determined as to extent, under almost all varieties of temure. In the instructions . . efforts were matle to impose something like a rule which should govern in the returns . . . but after a weary and unprotitable struggle, the superintement was fain to accept whatever could be oltained withont greatly criticising the form in which it came." (Ninth Ceusus of the Cuited States, 1870, Industry and Wealth, p. 72.)

Special instructions and procedures for the enumeration of farms in the somth have been used at the various Censuses in an attempt to prevent duplication and omissions. Usually, the instructions have suggested that the enumerator go first to the landlord to get all the required information regarding the farm operations for the home farm and for each tenant. Such a pro-
cedure was designed to movide for counting all of the land, crofs. and the landord's livestock once and only once. After the emmmerator's visit to the landlord, he was instructed to visit each temant on the landhohding in order to obtain other netessars information, such as "perator clatracteristics, livestock owned by the tenant, ete. In addition to the problems arising from the considerable amomat of shifting from year to sear in tenant operator's and in the acreage assiwned to tenants, there are other problems for an enmmerator. A tixel procedure cannot always be followed. As explained before, a kandord may mot live in the enumerator's assigned area, or may not he located convenientls.

Withont a stplemmatary reporting form for the over-all operafion, not only has it heen diffienlt to ohtain aceurate totals, but also, the data obtained have not been adequate to indicate the charaderistics amb funtioning of the larger operational units. On multiple units, part or all of the farm implements and machinery and amimals used by the tenants are owned by the landord and may, or may $n$ ot, he in the possession of the individbal tenants. Expembitures made by the landlord for his tenants may he included in the regort for the landlord rather than in the relorts for his tenants. Nou crops, or only feed corps, may be grown on land rotained by the landlord. The pastmreland, woodland, Wasterand, etc., which normally would be assuciated with the eropland, maty all be retained by the landlord. Thus, when the sembrate temant operations and uperations on land not assigned to temants are tommerated as individual farms, the separate reburts do not aplear to represant complete units. Therefore, for the varions classifleations of farms by size, by tennre of (口)erator, by type by economic class, or by any other frouping, the totals for some of the items may be distorted for particular gromps. This makes comparisons of totals for one item with another difficuh to interpret, or subject to incorrect interpretations.

The tise of a sumplmentars remorting form such as the Land-lord-Tenant gnestionmare for recording farts about the over-all operations, and mbiaining the information from the person considered tor be the hest informed has resulted in substantial improvement in the data tor the Census of Ayriculture in the South. Howerer, a briof alluraisal of the working and usefulness of the Lambord-Temant Quentionnaire reveals some existing problems. Many enmmerators hate finlts compretended the nature of the additional form and have performed acteptable jobs in (a) getting a report for the wer-all ofreation on the Landlord-Tenant Questionnaire and separate reports on the Agriculture Questionnaire for the component farms and (b) matehing of the data on the two types of forms so that there was atcurate counting without duplication.

Quite a few enumerators, in reary Census in which the supplemental furm has been used, lave not malerstood the supplementary nature of the Landlord-Tenant Questionnaire. To some of them. the filling of two questionnaires for the same land represented daplication in reporting and, heate, shonld be avoided.

Even thongh smme pmomerators did an aceeptable job in filling the Landlord-Tenant Questionnaite thes failed to always fill in an Agriculture Questionmaire for each of the tenants. In some cases, all of the holding was listed on the Agriculture Questionnaire as one farm, with the landord as operator. In such cases, it is assumed that the enumeratur did not consider the tenants to be farm operators and ighored his instructions and the wording of the inquiries on the Agriculture Questionnaire itself. (These inmuiries slecifically excluded from the landlord's net acres for his Asriculture Questionnaire all land worked for him on shares.)

In those instances where the lathd in a landlord-tenant holding extended into two or more enumeration districts, some enumerators did not understand how to divide the enumerating responsibility with other enumerators.

When the beadquarters of the over-all holding was in another enumeration district, some enumerators overlooked those tenant-
operated lands in their area when the teuant did not reside thereon.

When a landlord lived in an emumeration district other than the one, or ones, in which his lizulholding was sitmated. it was of ten difficult or not feasible fur the enunteratur. charged with the respusibility of filling the Laudlord-Tenant Qusstionnaire, to interview the landlord. In such situations, some Landlord-Tenant Questionnaires were wot filled his the enumeratur.

In some cases, there was coufusion as to how mans dericulture Questionnaires were neressary if, after the लlose of harrest, there had been a change in temant operaturs. In an April enumeration. as in 19.0. more enumerators than in 105 y (with an Octoter or November enumeration) listed on the Landlord-Tenant (snes. tionnaire both the whl atd that new tramat. Whers a ehange in
 ator. because of a fixed orn rotation brantice or for some other reason, had bewn assionted atifferent anteree fir m that which was farmed by his preduressur, a repurt was uften mathe obl the Landlord-Temant Questinmatire for the whe twant athl what ho graw and a secomd livting.  the Agriculture ghestimmatre was for the lambord shmon on

 was reriewed ta determint if it qualitiod as an maltjpe-mit operation.

Matehing the Agri"ulture Questionmaires with the LamathriTenant Questionnaires was time consmming ame al dimioult task A complete matching was not alwase possible. Finmmerators diat not always unter the name of the landlome ont the Agrioulture Questionnaires for temants. In some tastes, the mame potered for the landtord was latat of his agent "r mamager. In cate the land was subleased, the name oftell given for the landurd was that of the owner of the land or the flost landlord. For a manageal operation, the name of the manager was giver in some instanes and the name of the wwer in other lastances. lifferences in the surname spelling, in the initials, or in the first natust addell to the difficults in matreling.

Ennmerators were instructed ter cross-refereneq each Aurienlture Questionnaire listed on the Lamblord-Thant Questionmaire. Ennmerators did not alwass enter erossereference identification, especialls for tenants in other emameration districts since other enumerators were responsible for getting the Agrianlinre Questionnaire for those temants. This made it necessary to mateh 10 to 20 bereent of the Agricultnre Questionnaires on the basis of the name of the landlord.

As the Landmod-Temant Questionnaires and the whambent Agriculture Questimmaires were matchel. the information thereon was compared for all latal in farms, coplame harvested, temure of operator, number of borses and moles. and sifecified crops. C'sratitums were made on the Lamdlord-Tenant and dericuiture questiomatires in the cate of (onissions the ont of the other of the quentionatares, of whth entries alpatraty represented duphication in the reports of the landord atot or tenathts, or only the bandlordis or the tenant's share of croms.

If an - trianlture Questionmaire Was fonme tor a tenant mot disted on the Lambllorl-Temant Questionataire fin at lamburd, the Latate of this framat athd the correspombing intormation were puteral wh the Lamplord-Thamt Luestionnaire.  thnnatiren Wry preparen in the promessing office for tenants and

 frad twatal "perations shoma in the tables do not represent the Hethal mamber of sturd lictlangs.
 Was inlantitiod, thtals for seleated items wert ohtained at the maltiple-nonit level and the questiomaire was comed for eulor and tethire of the matiple-mat vierator. To obtain totals at the maltiple-nait lavel, information for the croppers was added to thatt lor the home farmo. Only these totals, plas a limited amonat of tiata at the lamderalemant level, were fansfermed to puntharads. Only one punchard was used for each questionmaire. The classifications by size of matiple unit, hy acres of eroplame larrested, by lyge of farm, and by kimd of thants were made mechanically wn the basis of the data entered on the puncheards.

Data for all farms were obtained from the tabulations of the Agriculture Questionnaires. For a description of the office procedures in editing, coding, and tabulating these data, see the Introdnction to Volume II, General Report, 1954 Census of Agriculture.) Data for farms not in multiple units were obtained by subtracting the totals for multiple-unit operations from those for all farms.

The data for multiple units for the 1954 Census include, as cropper subunits, all presons to whom work power was furnished liy the landiords.

Office-constructed questionnaires.-The number of LandlordTenant Questionnaires constructed in the processing office for both 1954 and 1950 is shown in Summary Table 2. That table also shows the number of questionnaires which were filled by Census enumerators.

The proportion of the uffice-constructed questionnaires which had no home farm, i. e.. those for which no Agriculture Questionnaire for a home farm could be located, is also shown in Table 2.

## DEFINITIONS AND EXPLANATIONS

Definitions and explanations are presented only for those items for which the table deseriptions are considered inadequate. The definitions consist primarily of a résumé of the questionnaire wording, occasionally supplemented by the more essential parts of instructions and procedures for enumerating and processing the Landlord-Tenant and Agriculture Questionnaires.

The multiple-unit area,-The multiple-unit areas comprise the counties in which croppers account for a significant part of all tenants. The multiplemnit area was established for the 1950 Census by including generally those counties in which there were 30 or more (roppers accounting for 10 percent or more of all tenants acoroling to the 194. Census of Agriculture. Minor bhanges were made, as will be explained later, in both 19.00 and 145t in the comnties included in the area in order to facilitate emmeration and office-processing. For lyst, the multiple-mait area includes 891 counties.

In the multiple-nnit area in 1954 , there were $1, \mathbf{i} 61,852$ farms, or 36.8 percent of the $4,752,416$ farms in the United states; and $268,74 t$ croppers, or 97.4 jercent of the croppers in the 16 Southern States and 7 connties in Sontheastern Missouri. For 1954, the multiple-nnit area accounted for 63.5 percent of the cotton acreage, 89.2 percent of the tohaceo acreage, 82.4 percent of the peamut acreage harvested for nuts, and so.5 percent of the rice acreage.

The enumeration of maltiple units was made in 19.54 in 1,003 comoties or in 112 counties mores than were included in the mul-tiple-unit area for which data are presented in this report. In 1950 the emmeration was made in 977 connties. In making the enumeration in both 1954 and 1950, the Landlord-Tenant Questionmaire was used in all the combties comprising a Field superrisur's district in order to simplify the giving of instrmetions, ordering of supplies, ete. This procedure resulted in the use of the Laudlord-Tenant Questionnaire in counties outsille the mul-tiple-unit area. Because the counties comprising a Field supervisor's district were not the same in 19i4 as in 1950, the procedures resulted in the enmmeration of multiple units in some counties in Inst that were not included in the area for the ennmeration of multiple units in 19.9 and vice versa. As a result of changes in areas included in the enumeration, 19 counties were in the multiplemit area in 1950 but were excluded from the area in 1954 , and 8 counties excluded from the multiple-unit area in 1950 were included in 1954. These counties together with data indicating their importance as part of the muttiple-unit area are as follows:

| County | 1950 farms | 1950 croppers |  |
| :---: | :---: | :---: | :---: |
|  |  | Total | $\begin{aligned} & \text { In multiple } \\ & \text { units } \end{aligned}$ |

NA Not svallable
Minus sign indicates fewer farms for 1954.

A complete list of counties included in the area of enumeration and in the multiple-unit area in 19:-4 is given in the Appendix.

Landlord-tenant operations containing multiple units.- I land-lord-tenant operation consists of all the land held by a landtord who rents land to one or more tenants, including croppers, and retains some land not assigned to tenants, or who rents land to two or more temants, inchading croppers, and retains no land for himself. The landlurd may hold the land through ownership or through lease, rental, or cropping arrangement, or as a bired manager for others.

The home farm, if one, plus all component tenant farms, including cropper farms, make up the landlord-tenant operation. The home farm and one or more cropler farms make up the multiple unit. If there was no home farm, then two or more comper farms wert reypuired to constitute a multiple unit. Thus, all multiple units represent a landlord-tenant operation or a portion thereof. If croppers were the only kind of tenants represented in the landlord-tenant "peration, the multiple unit was identical with the landlord-tenant uperation. If there were tenants in addition to croppers, the olerations of the additional tenants comprised part of the landord-tenant operation but not a part of the multiple unit.

For multiple-mit purposes, a cropler subunit is one for which the findord furnished the work power. Some persons may have all their work power furnished for their entire farming operation, even when they work separate tracts of land for different landlords. A cropper with two landlords conld be counted more than once as a rropper subunit of a multiple unit. Other persons having two or more landlords may be furnished work power by one landlord hut not by the other. In such a case, the cropper land could be a subunit of a multiple unit for one landlord but not for the other. Still otber persons, who own and operate land on their own acconnt, may rent land and be furnished work power for the rented portion. In such cases, the cropier land could be a part of a multiple unit.

Census enumerators were not given the definition of a multiple unit. The existence of a multiple unit was determined during the offlce processing of questionnaires.

Subunits.-A subunit denotes a component part of a landlordtenant or multiple-unit operation. The land assigned each cropper or tenant is a subunit. The land retained by the landlord, i. e., the land not assigned to tenants including croppers is likewise a subunit. Each subunit is a "farm." as defined by the Census, except for tenants, including croppers, who own and operate or rent and operate, additional land. (See discussion under "Tenants.") One of the subunits of a landlord-tenant operation is usually the "home farm." The other subonits are classed as cropper farms, sharetenant farms, and other-tenant farms (not cropper or sharetenant farms).

A home farm includes all the land in a lamblord-tenant opreration not assigned to tenants, inclizding crourers. In a multiple unit, the home farm is the portion not assigned to croppers. In a landord-tenant operation containing a multiple mait. the home farm of the multiple unit is the same as that of the landlord-tenant operation. The home farm was determined by subtracting, from the over-all landlotedenant "peration. the operations uf ail tenant subunits. (See "Office procedures.", The fome farm hasally contains the home of the multiple-unit operator or the headguarters where work stock and enplipment are kept for the entire multinde mait operation. It usushly indudes land worked by the multifle-unit onerator with the he? of his family and/or hired labor. Hecasionally, at home farm may consist only of pastureland not assirned fur the exelusive ase of creppers or temants, and wombland or wasteland. Ibume farms of lambord-tenant and maltiphe-anit whations wera considered farme for Census purpuses if thay centainet threa or more acres even thongh the agricultural alerations on the home-farm tract may have bean insufficient to qualify as a Census farm.

In sone multiple-mat operations all the lamt is assional to croppers. Such maltiphe mits do but have hime farms. In most of these cases, the maltiple unit operatur dous not bive on the plare.

Tenants rent from others or work on shares for otbers all the hand they olverate. When used in arferente to shbmite of a mandordetemant or maltiple-unit aferation, the temare relates onts to land "perated in that landlandetemant or maltiple-unit operation. For example, a temant or craper of a partimatar landord mas also rent land from, or "rop land fur, wher land. fords: or be may own land on his own ateonnt. In such instances, in presenting statistics for landhord-tenant and mul-tiple-unit uperations. the submat operated by the eropler, or temant other than cropper, was treatod as thongh it were a
 and varles from that used in tabubating data fur cemsus farms. In the data for census farms the entire acreage ondated. including land owned and or land remted from others, was, eounted as one farm. The trom "tenant" mav also he nede in reference to the classitication of a multiple-unit operation when all the land in the oferation is rented from others.

Cropers sometimes have heen defined as crop-share thants whose landlords furnish all the work power. For concenisuce, the classification was hased entirely on whether the landlord furnished all the animal or trator pawer. The laws of some States detine a sharecropper as a tenant. In other states, a cropper mas be legally classifled as either a laborer or a tenant. depending upon the nature of the agreement under which he produces a erop. In most States, court deelsions as to his tenure status have been based on whether he had title to the cror and upon harvest, paid hls landiord a share, or whether the landlord retained title to the crop and. ufon harvest. paid the cropper his share after deducting any advances in cash, credit, supplies, etc.

Most cropper farms represent subunits of multiple-mult operations. However, cropper farms may be operated as inder pendent unlts, the landiord weither having other croppers nor farming any land with his own labor or with the belp of members of his family and/or wage workers. Thins, the count of the farms not in mintiple units includes some farms operated by croppers. As mentioned bepore, croper farms and eropper subunits are not necessarily synonymous.

Share tenants are tenants other than croppers who pay their landiords a share of either the crops or livestock products, or a share of both.

Other tenants in this report refers to all tenants who were not classitied as croppers or as share tenants. In the other reports of the 1954 Census of Agriculture. "other tenants" represents a more restricted group than in this report.
A farm.-For the $195+$ Census of Agriculture, places of three or more acres were counted as farms if the value of agrieultural products in 1954 . exchusive of bome gardens. amounted to $\$ 150$ or more. The agricultural products cuald have been either for home use or for sale. Places of less than three acres were counted as farms only if the ralue of sales of agricultural products in 19,4 amounted to $\$ 1.50$ or more. Places operated in 1954 for which the value of agricultural products in 1954 was less than these minima because of erop failure or other unusual situations, and places operated in 1954 for the first time, were counted as tarms if, nurmalls, thes could be expected to produce these minimum quantities of tarm products. As explained above, an exceptinn to the criterion in regard to the value of agrientrurat produrts problued was made for home farms of hambord-tenant ami maltiple-unit operations. The 1950 detinition of a farm was identionl with that of 1954.

All the land umber the immediato control of one person or parthershin was incladed as whe farm. Control may lase been thrmigh wwarship, or throhah letast, rental, or croping arrangement. Land worked wh shares fur others was considered as under the immediate eontrol of the persun working the land. Thas, the bamd assighed to a croper or tenant other than croper Wias considered a semarate farm even though the In adord may hand fasely supervisal the crapler or temat other than eropper and hatudal has the bandurdis) entire holding essentially as Whe "lertiting unit.

Farms in multiple units are the cropper and home-farm submoits comprising the multiple unit.

Farms not in multiple units are those which are not parts of multiplembit "perations. Some of the farms not in multiple mits represent farms in handord-temat operations. Tha infurmation shown for farms mot in maltiple-unit oprations was ohtaind by subtrating the totals for maltiple-mit operations fromt those for all farms, (For an aboraisal of this frocedure, se, "Reliability of Dita"
Multiple-anit operator. A multiphemat oneratur is the person who dirests or sumervises the multiple-mat operation. In this refort, the maltiple buit operator is frequently referred to as the lamdord. He is the person who controls the land either through ownership, lease, rental. or cropping armange ment. Therropmer in ihe uraltiple unit works land on shares for him. The matiple-unit operator may heathred manager empluged hy the person whacontrols the land. The number of maltiple-nomt "fraturs is considered the same as the number of moltiple units.

Farm operator.- A "farm operator" is a preson who operates a (ensus-thtibed farm, wher parforming the labor himself or diremply shervising it. Hu may le an owner, a hired manager, or a temant, renter, or sharecomper. If he rents land to others or has land "rupped for him hy others, he is listed as the operator of only that lamd which he retains. In the case of a pertuership. whe member ohly was itmbuled as the operator. The number of farm aperators, therefure, is considered the same as the namber of farms.

Units, farms, or operators reporting.-Figures for mills reporting, farms reporting, or operators reporting represent the mabler of multiple units of other designated units, the number of farms, or the momber of operators, for which the specitied item was reported. For example, if there were 240 multiple units in at county and 187 of these harvested tobacco in 1954 , then the number of multiple mits reporting tobacer would be 187 . The differences in the fotal number of multiple units and number reporting an item represents the number not having that item, provided the inquiry was answered for all mulliple units.

Land owned and land rented from others.- The land to be incinded in each landhord-tenaut cheration was determined ly asking the nmmber of acres owneld and the arres rented from, or worked on shares, for others.

Land owned incomes all lam whirh the oprator or his wife, or both, hold moder title. purchase contract homesteral law, or as one of the heirs, or als a trustee of an undivided estate. In the rase of a mamaged opleration, the inquiry on the LatudnordTemant (questionatire related to the land owned be the emploser.
Land rented from others includes land worked on shates for others, amd lamd nsed rent free, as well as all land rented or leased under other arrancements. In the case of a managed oferation, the inquiry wh the Landmerdenant Questimmaire related to the land rented from others ly the employer.
Land in the landlord-tenant operation represents the sum of the land ownet pins that rented from others by the landore. The total of the land in all subunits emmpisine a dandlorel-tenant operation is identical with the total land in the landord-remant aperation.

Land in the multiple mit remermite the sum of the land in the home-farm subunit phos that in then "romer sobunits, Lamel rented hy the multiple-mit operator to temants other than croppers is excluden from the multiplamit neration, hy definition.

Land in farms. - The acredge in eath filmo wats ohtained by adding the acres owned by the falm ogerator and the acres rented by him from otheis or cropped on shates by him for others, and subtraving the arese rented to or worked on shares bey others

The acreage dexignated "land in farms" ineludes eonsidfable areas of land not acthally under coltiration and some lamd not used for fasture or trazine. All wormantand wasteland owned hy farm op rators, or included in tracts rented from others, is included as dand in farms matess suth land was held fur wher than atricnltural purposes, or unless the acreage of such land hele by a farm operator was musually large. If a place had $1,0 \mathrm{mo}$ or more atere of land not beine nesed for acricultural furposes and less than 10 percent of the total arreage in the place was used for agricultural burgoses, the nonagricultural ham in excess of the number of acres used for agricultural purpases was exmuled frow the farm area. For application of this rule, land rented out was considered to be used for agricultural purposes.

Cropland harvested.-This represents that gertion of the lame in the multiple unit, or in the farm (subunit or wherwise), from which crops were harvested in 1954 includiug lamd from which lay was cut and land in small fruits, orthards, vinevards, uurseries, and greenhonses. Land from which two or more crops were harvested in 194.9 was to be counted only once.

Crops harvested.-The Landlord-Tenant Questionnaire asked sipecificalls concerning five erons harvested in 10, 4 , viz, corn, cottom, tobace, rice, and manuts. The inquiry for corn was restricted to corn harvested for urain and that for peanuts, to peanuts harvested for picking or threshing. Data for crons shown fur :lll farms and for farms not in multiple units are limited to those slecified on the Lamblord-Tenant Questionnaire. The crops were to he these harvested in 1954 from land muder the control of the operator in 19.4 regardless of whether the crops were grown lis the operator or liy somente else. Crops grown by the operator (on land not under his control in 195t were not to be included.

Horses and mules.-The inquiry vatled for horses and mules of all ages. The burses ant mules were to be reported for the farm or unit where kept, rugardless of ownership, If horses and mules owned by a multiple-tuit operatur and furnished to the croppers were kept on the cropper farms, they were to be included on the Agricultme Quentiomaires for the croppers; if kept on the nome farm, they were to he reported on the dgriculture Questionnairt for the home farm. Thas, in the maltiple-unit area, many of the farms not rejorting horses am? mules represtat cropper farms for which the borses and mules were reported on the home farm.

## CLASSIFICATION OF MULTIPLE UNITS

Multiple units by size.- Aultiple mits are classified by size according to the total land area in each multiple-unit operation. Thes size groups used are the same as these for the classification of farms by size, with the exergtion that all multiple units of less than 30 arres are in a single gromp. For farms, separate data are atalable for three eronps under 30 acres-viz, (a) farms nuder 3 acres, (b) farms of 3 to 9 arres, and (c) farms of 10 to 2 : acres.

Multiple units by color and tenure of operator.-Multiple-mit ण隹:ators ant clasitied hy color as white and nomwhite. Nonwhite inclules Negroes alld all other nonwhite races such as lutians. ('hinese, Jumanese, etc. In the multiple-unit area nearly and of the monwhite oberatore of multiple units amb of farms are Nugroes.

Multiple-mat merators are massified acoording to the temure mader which they hoble their lame on the basis of the total land whed and the total lamel rented from others, and on the basis of the reply to the inctiry, "Do yon operate this land as a hired mabager?"

Full owners nwn land lont do mot rent land from others. Also inclumed in this group are those office-constructed multiple units for whid no home farm Aqriculture Questionnaire could be lotenterl.

Part owners own ladd and rent land from others.
Managers "perate land for others, directing and supervising the eftire multiplewnit operation, amd are pald a wage or salary for their services. Anttiple-mit "perators were classified as mamagus when the answer was "ses" to the question, "Eo son operate this labl as a hired manager?"

Tenant-multiple-unit operators rent from others all the land in llo maltijhe-unit meration. 'llaey own no lant.
Multiple units by type of farm.-. Mbltiple units are classified as (0) tyat un the hassis of the kinds of crons larsested and the rela(Lmblap ut the acreate of each crop harvested to erophand harrested and to wther (rops harvested. Only the principal cash 'roms.arothon, tobaceor, peamuts, and rice-were used as a basis $\mathrm{f}_{\mathrm{n}} \mathrm{H}_{\text {the }}$ thas sitication by tyle.
If only omt of these cash crons was of primary importance, the maltiphe ufit was desimaterl as that crob tylue A crop was considered as being of frimary inumetane when its acreage represented 10 percent or more of the acres of eropland harvested in the rats of cotton, beanuts, wre rice, or 2 pereent or more in the rase of tobacer.

To be considerad of socondary importane the acreage of a given crop-cotton, peambts, or rire-bad to equal or exceed 10 fereent of the arract of the primary erofs, provided the primary (rop was hot tobaco If the pribary crop was tolaceo, it was heresiars for the acreage of cotton, pealluts, or rice to equal or to excerd the tobardo arreage in order to be emmidered a sefondary erom. Tobaceo was considered a secondary erop when it comprised at least 1 bercent lat less than - percent of the total eropland harvested.

If ohe of these tash crops was of primary importance with one or more of secontary imporiance, or if two or more were of primary importance, the multiple hint was dassified as a combina-tion-crop type. For the combination types, all of these crops of either primary or secontary impurtance are inticated by the type name. For the comblination types, the type name does not distinguish the relative impurtance of the croms comprising the comhination. Thus, in a "enton and tobaceo" tspe, either the cotton may be of primary importance with tomaceo seconfary, or the tobace⿻ primary with cotton secondary, or both crous way be of primary imprortance.

If a multiple mit did not qualify as either a primary-crop type or a combination-crop type, it was classed as "miscellaneons." Thus, the "miscellaneous" tyre inchmes multiple-unit operations
with none of the four dexignated crops remorted : alsw, thuse fur which none of the dexignated crons were considered of primars importance.
Multiple units by acres of eropland harvested. -This clacsift tion was based on the acreage from which crops were harse in 10.7 fur each multiple mit. The grouns are the same as tho used for Censhs farms excelt that the smallest acere sroup fot the multiple-mit classification includes those with less than aeres of cromhand harsested, whereas. for Censhs farms with lews than 24 acres of crmblad harseated, two crums are shown, viz. those with lese than 1 la arese of compand harvested and those with 10 to 19 andes for this lamp hat

${ }^{1}$ To obtain comparability with 1854 and as published in this report
2 In 1250.
Reliability of data. -The use of the ingniry regarding the furwishint of work prwer as a hasis for dassifying croplers results in the inclusion of some farm aperators who do not have the characteristics generally associated with cropper-pperated farms. These farm operators comprise, largels, relatives of the landlord to whom the landord furuishes all work power, equipment, etc. some of these cropper oferations may be relativels targe and of a tyle of farm not similar to the type of farm tenerally operated bs croppers.

The arransement of the inquiries on the Landlord-Temant Questionnaire made it possible to present data giving a count of those share tenants who were not eroplors. It is this group of share tenauts, wholly excluded from the multiple units, which was most likely to have contained dependent tenants whose operations wouk have been eligible for consideration as an integral part of a multiple unit if satisfactory criteria could have been applied to designate them. To complete the picture of the over-all landordtenant operations, a count of the other subunits comprising them has been made. This number is shown in several of the tahles under the heading, "other tenants, not croppers nor share tenants."

In using the data presented in this report, it is necessary to consider not only the effert of the procedures upwn the data but, alsw, the accuracs of the Landord-Tenant Questionnaires.

In evaluating the data given in this report, consideration sbould be given to several factors:

First, the definition of a multiple unit was established arbitrarily on the basis of the presence of croppers. Some of the cropper subunits comprising multiple units mas not be under the close supervision of the landlord and may be operated as independent units. Noreover, some tenant-operated farms not included in multiple-unit operations may have been under the (lose supervision of the landlord and may have been operated as a part of a larger operational unit.

Second, during the offle processing, Landord-Tenant Questionnaires were prepared in 1954 for 14,186 multiple units. These office-constructed questionnaires represented 10.8 percent of the multiple units. For 3,$86 ; 7$ of the oftice-ronstructed questiommaires, there was no Arriculture Questionnaire for the landlord and, in such cases, it was not possible to determine with certaints the total acreage held by him, or his tenure. However, for statistical purposes, it was assumed that the sum of the aureage of hand shown on the Agriculture Questionnaires for tenants of surh landords represented the total acres of land in the landurd-tenant operation and that the landord owned the land.

Third, in some cases, the number of multiple units, as well as
the number of subunits, may have been overstated. Because of differences in names reported for the landiord an additional Landlord-Tenant Questionnaire may have been constructed. Likewise, tenants may have been included as part of a landlordtenant operation when those tenant operations were already listed on a report with a slightly different name, or under another name if either the Landord-Tenant or Agriculture Questiomaire erroneousty listed the 1955 tenant instead of the 1954 operator. Also, most of the matching of Landlord-Tenant and Agriculture Questionnaires was performed on a county basis. In some cases, where the temants belonging to a land-lord-tenant operation were enumerated in two or more counties, a Landlord-Tenant Questionnaire may have been constructed because the original Landlord-Tenant Questionnaire was enmmerated in another county.

Fourth, since a cropper subunit in a multiple unit did not always comprise an entire Census farm, the procedure of subtracting the number of subunits from the number of farms, or from the number of farms reporting, resulted in an understatement of the number of farms and number of farms reporting for such items as corn, cotton, tobacco, rice, etc., for farms not in multiple units. This understatement arises because of croppers having two or more landlords. If the cropper rented land from more than one landlord who furnished work stock or tractor power, then such a cropqer would have heen counted as a subunit on more than one multiple unit. A tabulation was made for a sample of 4, comuties, containing $14,40 \mathrm{~m}$ multiple units, of the cropper subunits having two or more landlords in 1954 . On the hasis of this sample, it is estimated that there were 17. S4; cropper subunits in the multiple-unit area baving two or more landords. (The chances are about 2 out of 3 that this estimate wond differ by not more than 9 percent from the results , htatined by makins the same tabutation for all multiple units.) Thus, the number of farms not in multiple units is monderstated hs at least 17,006 . Farms remorting cotton, corn, tohacco, rice. etc., for farms not in multiple units are also affected hy a procedure of subtracting eroper sabunits reporting from all Census farms reporting.
The failure to detert the duphiation of the eropper submits on a Landhrd-Tenant Questiomnaire becanse of differences in the reported name for the same (romper, and the inclusion of cropper subunits which did not gualify as Census farms on the LandlordTenant Questionnaire also resulted in some orercometing of cropper subunits and consequently in an understatement of the number of farms and farms rearting. for farms not in mubtiple units.
lata from the Censuses of Agriculture indicate that there were Landlord-Tenant Questionnaires for practionlly all the landlordtenant merations in the multiple-unit area. According to the Census of Agriculture, there were 333,784 farm operators in the multiple-unit area with land rented to others. For fach of these farm operators there should have been a landordTrmant Questionnaire. The tabulations for this report inchuded : $41,2=9$ landmod-Tenant Questionnaires. Ihwever, 5,136 of these questionamires did not have home farms and, hence, the landford would not have been counted among the 333.7st farm operators renting tand to others in the census of Agriculture. On the hasis of these data, there should have heen 335,000 Landord Tenant Questiomaires in the multiple-noit area as compared with the 341,229 actually included in the tabulations.

For 1954, for wost states there are more "romer subunits in multiple units than there are farms operated by ernpers as shown hy the Census of Agriculture. This inconsistency resulted from (1) the comating more than unce of the same aroliger as at cropper subunit in "ase the crollier rented from two or more landlords; (2) the counting in the census of Azriculture of croppers listed on the Landord-Temant Questionnaire as part owners becanse the person also operated land he owned; and (3) the counting of "roppers listed in the Landord-Tenant Qnestionnaire as tenants other than croppers in the Census of Agriculture because such croplers also rented land, but not as a cropper, from another landlord.

As stated ahove, it is estimated that at least 17,000 cropper subunits were counted on more than one Landlord-Tenant Questiomaire. Estimates hased on the same sample used to estimate the number of subunits having two or more landords
indicated that there were approximately 17,000 cropper subunits with croppers reporting that they also operated land they owned. Thus, it is estimated that there were, in the multiple-unit area, approximately 29,000 cropper subunits which would not have been counted as cropper-operated farms in the Census of Agriculture.

The procedure for showing the data fur a multiple unit in the county in which its headquarters is located and the data for indisidual farms comprising the multiole unit, in the counts in which the farms are located, affects the totals for farms not in multiple units in connties where some of the farms comprising the multiple unit are lecated in different counties.

Comparability of multiple-unlt statistics for 1954 with prior Censuses.-Because of the lack of comparability of the data for 1954 and 1950 with those for prior Censuses, all data presented in this report are for the two most recent Censuses. The deflition of a multiple unit for 1954 was not fully comparable with that for 1950 .

A multiple unit for the 1954 report was a landlord-tenant operation containing two or more cropper subunits if there was no home farm, or it included one or more cropper subunits if there was a houle farm. The eropmer shbunits inchuded persons sharing in the crop to whom the landlord furnishes all the work power. Assmming two landlord-tenant operations had the same tenants. the cropper subunits may lu (/) persons who have work power furnished by their landlords for all the land they operate: (2) they may own land on their own account and be a cropper subunit on the rented fortion : or (.s) they mas be a cropper smbunit on ooe landlord-tenant operation and not on the other.

A multiple unit for the dañ rejort was a lambord-tenant ob eration containing two or more cropper submits if there was no home farm, or if it included one or more cropper subunits when there was a home farm. A eropmer submit was restrleted to those bersons whose landlords furnished the work fower for all the land they operated. Thus. in 19.0 , a croper whose hand was a subunit of a hadiordtenant hobling was not considered a part of
a multiple-nnit operation if he owned and operated additional land or if he rented additional land in other than cropper status.

It is estimated that there were approximately $\mathbf{1 7}$.0wt cropper subunits in multiple units in 1954 that were counted as part-owner operators in the Census of Agriculture because the crupper on the muitiple unit also farmed some land he owned. Such cropper subunits would not have been included in multiple units for the 1950 Census. Except for the inclusion of cropper subunits for croppers owning land in multiple units in $19 \overline{9}$, the definition for a multiple unit in 1454 and 1950 was the same and it is believed that data for 1954 and for $19 \pi 0$ for multiple units are reasombly comparable.

For 1945 , statistics for multiple-unit operations are presented in a special report entitled. "Multiple-Init Operations." Iata are shown for 567 selected counties in 9 States.

For 1940 . statistics for plantations are presented in a special leport entitled, "special Study-Plantations." Only a very limited number of copies was printed and distributed, primarily to the Land-Grant Colleges in the Sonth. If any of the 1940 data are desired, and the 1940 special report is not araibable in a reference library, copies of the tatmar material may be obtained from the Burean of the Census by baying the eost of making n photostatle cops. In the 1940 report, statisties are presented for the phantation as a whote, also for the farms comprising the phantation. Data are shown for $3 \mathrm{~B}^{2}$ : selected comaties in 10 States.

For 1 ollo. statistics for pantations were published as chapter Ill in Volume $V$ of the 1 gato (emsus reports and ln a monograph based on this and other statistical material issued by the bureau of the census in 1916 entitled. "plantation Farming in the lonited States." Hata are shown for aroas representing 325 selected comities in 11 stittes.

The accompanying tabular presemtation of the areas covered in moltiple-unit or plantation studies and the definitions provide a convenient reterene of the differences in the statistical treatment of multiple-buit oprations for the several femsuses.

The Landlord-Tenant Questionnaire (A3) is to be used in all counties in the following States: Alabama, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, and South Carolina; and the following counties in Arkansas, Florida, Missouri, Tennessee, Texas, and Virginia:

| Form | U. S. DEPARTMENT OF COMMERCE <br> BUREU OF THE CENSUS <br> WNSHIGTTN |
| :---: | :---: |
| A3 | LANDLORD-TENANT QUESTIONNAIRE |
| No. | Census of <br> Agricullure |

FOR WHOM SHOLLD THIS QLESTIONNARE BE FILLED?
(I) For every person who operates a farm himself either alone or with the help of his family or wage hands, and also rents farm land to othere or has land worked on shares by others,

OR
(2) For every person who does not operate a farm himself, but rents farm land to two or more persons or has farm land worked on shares by two or more persons.

## WHOM TO INTERVIEW

You should interview the landlord (person named in question 1) to fill this Landlord-Tenant Questionnaire.

214. Purposes of the A3
215. Helps to get all Al's required

The Jandlord-Temant Questionnaire has two main purposes:

1. It helps in getting the Al's.
a. It helps you to get all the required A1's. In some cases the landlord will tre to include on his Al information for all his operations, including those of his tenants, renters, and croppers. Also some temants-rsperially roppers-will consider their operations as belonging to the landlord. You are required to get an Al for each tenant, cropper, and renter.
b. It helps to prevent duplatation and omission of any of the information. If the lamdlord includes information on his Al for his tenants or croppers we will have information reported twice for the part operated by his tenants. On the other hand, the information will not be complete if the tenant or cropper fails to report information because he thinks the landlord should report it on his Al.
2. It provides statistical information for the overall operations by persons who farm their land with sharecroppers.

Column 11 of Form A2 shows you when you are to get an A3. These instructions indicate you are to get an A3 when--

1. The landlord or landowner operates a farm himself and also has one or more teants, renters, or croppers.
2. The landlord or landowner does not operate a farm himself, but has two or more tenants, renters, or croppers.

## DETAILED INSTRUCTIONS

## 219. Who gets the A3?

## 220. When to fill the A3

221. What to do if A1 is filled before you get A3

## 222. Section I

223. Section II
224. Section III
225. Section IV

## 226. Do you get the A1?

## 227. What if tenant has moved?

## 228. Checking the A3

229. Checking A3 with Al's
230. Fill an Al for each tenant

## $230 a$ Line A

Sometimes the landlord or some of his tenants may live in another enumeration district (ED). In such cases, only one enumerator should get the A3. The following rules tell you whether or not you are to get the A3:

1. If you get an $A 1$ for the landlord, you should also get the A3.
2. If an A1 is not required for the landlord, but he lives in your ED and one or more of his tenants are in your ED, you get the A3.
3. If the landlord lives outside of your ED but all his land is in your ED, you get the A3. Get the information from the landlord if he does not live more than 15 miles away; otherwise, get the information from the tenants, croppers, and renters.
4. If the land lord lives outside of your ED but farms land where he lives, or has tenants where he lives, you do not get the A3.
5. If you have any doubt whether you should get an A3, fill one and explain the situation under Remarks or in the margin of the A3.

You should fill the A3 before you fill the A1 whenever possible. This method will enable you to copy some of the information from Form A 3 onto the A 1 . In case the tenant rents all the land from one landlord, you may omit asking those questions on the A1 for which you have already obtained the information from the landlord.

If you get an A1 for a tenant before you get an A3 for the landlord, compare all the entries on the A 3 with those on the Al for the tenant. If the tenant does not rent land from anyone else, correct the information on the Al for the tenant. You must ask the tenant if he owns any land or rents any land from another landlord. If the tenant owns land or rents land from another landlord, then you must ask all questions on the A1.

Notice that the questions in Section I refer to the landlord (or hired manager) and to the total acreage under his control.

You are to ask the landlord the questions in Section II (lines 1 through 10) for each tenant, cropper, and renter.

The questions in Section 111 are for you to answer. You do not ask the landlord these questions.

You are to ask the landlord the questions in Section IV (lines 1 through 10) only for those tenants who pay (or receive) a share of the erops as rent for the land they use.

To determine the answer to the question in column 4 "Do you get the A1 for him?" refer to column 13 of the A2. You get an A1 if-

1. The tenant lives in your ED.
or
2. The tenant does not live in your ED and does not have agricultural operations where he lives.

You are to visit each tenant for whom you are to fill an A1.
If a tenant, renter, or eropper has moved and the landlord has not yet rented the land to someone else, include the information for the tenant's operations with the home farm (line B).

The entry for column 2 on line C (Section II) must agree with the entry in question 7 of Section I.

The entries for line B , the home farm, must agree with the corresponding entries on the Al for the landlord.

Be sure to fill an A1 for each tenant, cropper, and renter who is listed in column 1 when required.

Enter the sum of these entries for all tenants on line A. If you fill more than one sheet for a landlord, enter the total for all sheets on sheet 1 .

You may transfer the applicable information from the A3 to the Al's for the tenants, eroppers, and renters listed in column 1.
